

Kookee Deployment Plan – Simple Overview

This document explains how we can deploy the Kookee system in a simple, cost effective way. The goal is to keep monthly costs low, ensure reliability, and make future updates easy.

Domain

Main domain: **kookee.co.ug**

We will use subdomains such as **api.kookee.co.ug** and **admin.kookee.co.ug**.

1. Backend (API & Database)

The backend will be hosted on a Hetzner Cloud VPS. This is where all system logic and data live.

- Server: Hetzner CX22 (2 vCPU, 4GB RAM)
- Cost: About \$10 per month
- System: Ubuntu, Node.js, PostgreSQL database
- Secure API hosted at api.kookee.co.ug with free SSL
- Stable setup with automatic restarts and backups

2. Admin Web System

The admin dashboard (web system) will be hosted on Vercel using their free plan. This is ideal for fast and secure web apps.

- Hosting: Vercel (Free)
- Domain: admin.kookee.co.ug
- Automatic updates from GitHub
- Free HTTPS security

3. Mobile Applications

The Sales App and Merchandiser App will be built and distributed using Expo.

- Build system: Expo (Free)
- APK files can be shared directly
- Optional Google Play Store publishing (\$25 one time fee)
- Easy future updates

Estimated Monthly Cost

Total monthly cost is approximately **\$10–15 per month**.

What I Need to Proceed

- Access to the domain kookee.co.ug (to configure subdomains and SSL)

Recommended Order

- Set up the backend server first
- Deploy the admin web system
- Build and distribute the mobile apps
